Roseville, CA · wangjiping44@gmail.com · (850) 300–2359

SUMMARY

Ph.D. Candidate in Statistics with industry experience in data science through internships at Genentech and Ocular Therapeutix. Experienced in statistical modeling, machine learning, Python, and SQL, with a strong background in simulation, optimization, and high-dimensional data analysis. Develops rigorous, scalable solutions to complex real-world data science problems, combining statistical methodology with computational implementation.

EDUCATION

Florida State University *Tallahassee, FL*
Ph.D. Candidate in Statistics *(GPA: 3.98/4.00)* *Aug. 2020 – Spring 2027 (Expected)*

Xiamen University *Xiamen, China*
M.S. in Mathematical Statistics *(GPA: 3.71/4.00; Rank: 1/17)* *Sep. 2017 - Jun. 2020*
B.S. in Mathematical Statistics *(GPA: 3.77/4.00; Rank: 2/31)* *Sep. 2013 - Jun. 2017*

PROFESSIONAL EXPERIENCE

Product Development and Data Science Intern May 2025 – Nov 2025
Genentech

- Simulated longitudinal visual field data to augment limited real-world datasets, enabling large-scale evaluation of experimental designs and statistical endpoints.
- Quantified trade-offs across experimental designs and demonstrated that cluster-based designs reduced required sample sizes by 40%, supporting more efficient study planning.
- Developed and evaluated slope-based progression endpoints against established event-based metrics, improving sensitivity to progression and enabling earlier detection.
- Implemented statistical models, including piecewise linear regression, hierarchical Bayesian models, and AGIS, to analyze pointwise visual field measurements and quantify progression patterns.

Biostatistics Intern May 2024 – Aug 2024
Ocular Therapeutix

- Conducted simulation studies in R to evaluate statistical models for longitudinal data under varying treatment-effect scenarios.
- Generated and analyzed simulated longitudinal datasets with repeated measurements, evaluating model performance through hypothesis testing and treatment-effect estimation.
- Applied linear mixed-effects models with treatment, time, treatment-by-time interactions, and baseline covariates to assess differences between experimental groups.

SELECTED PROJECTS

Hierarchical Sure Independence Screening for Multiresolution Classification Aug. 2023 – Present

- Invented HierSIS, which lifts sure independence screening from flat to hierarchically structured multinomial responses by screening separately at each node of the class hierarchy, with sure screening guarantees generalizing Fan & Song (2010).
- Demonstrated higher true-signal recovery than flat SIS and penalized regression competitors in simulation studies across $p \in \{1500, 2000, 3000, 5000\}$ predictors.
- Applied to the Hao et al. (2021) PBMC scRNA-seq dataset (152,244 cells, 27,373 genes, 24 fine cell types nested in 11 coarse classes), improving macro-F1 by 0.02 and balanced error rate by 0.03 over the leading competitor (mrMLR).

Matrix-Response Regression with Low Tubal Rank and Sparsity *(Manuscript)* Jun. 2022 – Dec 2025

- Proposed a matrix-response regression framework integrating low tubal-rank and sparsity constraints for structured high-dimensional data.

- Designed proximal gradient and linearized ADMM algorithms with convergence guarantees; proved non-asymptotic error bounds and variable selection consistency under restricted strong convexity.
- Benchmarked against 6 competing methods across 9 simulation settings, consistently achieving lower estimation error, better rank recovery, and variable selection consistency across sparsity structures.
- Applied to EEG seizure data (19 electrodes, 60 timepoints), pinpointing electrodes P4, C4, and T4 as the strongest seizure biomarkers, consistent with established neurological findings.

Censored Mean Variance Sure Independence Screening for Ultra-high Dimensional Survival Data
Mar. 2018 – Oct. 2019

- Developed a model-free feature screening method for ultra-high-dimensional survival data under censoring, with rigorous theoretical guarantees
- Established sure screening and ranking consistency properties under mild regularity conditions, supported by formal proofs.
- Conducted extensive simulation studies demonstrating near-100% true-variable inclusion rates under 20%–40% censoring.
- Applied the method to breast cancer survival data, achieving the strongest overlap with consensus gene sets and the lowest Kolmogorov Smirnov distance and Cramer-von Mises distance for Cox model compared with competing methods.

TEACHING EXPERIENCE

Instructor of Record, Florida State University Spring 2022; Fall 2023; Spring 2024

- Taught STA 1013 (Statistics Through Examples) as sole instructor for 3 semesters; responsible for course design, lectures, and grading.
- Used real-world datasets and R to connect statistical theory to applied reasoning and interpretation.

Teaching Assistant, Florida State University Aug. 2021 – Present

- Assisted in undergraduate and graduate courses covering regression, probability, and statistical computing.
- Held office hours and graded assignments for courses using R, Python, and MATLAB.

TECHNICAL SKILLS

Programming: Python, SQL, R, MATLAB

Machine Learning: Statistical Learning, Deep Learning, Large Language Models (LLMs), Natural Language Processing (NLP)

Statistics: A/B Testing, Causal Inference, Bayesian Modeling, Missing Data, High-Dimensional Statistics

Optimization: ADMM, Proximal Gradient Methods, Large-Scale Simulation

Frameworks: PyTorch, scikit-learn, NumPy, Pandas, Transformers, HPC/Slurm

HONORS

American Statistical Association Florida Chapter Student Presentation Award	*Mar. 2024*
Clara Kibler Davis Scholarship	*Oct. 2022*
Graduation with Honors (Cum Laude)	*Jun. 2020*
Graduation with Honors (Cum Laude)	*Jun. 2017*
